

# A Novice Uses FEniCS

Andy R. Terrel

with lots of guidance from Anders Logg and Robert C. Kirby

University of Chicago, Chicago, IL

# Contents

- Who I am
- My Problem
- How FEniCS works well
- Some difficulties
- Some results
- Conclusions

# Who I am

- Second year graduate student in Computer Science,
- BS in Physics/Math, BA in Philosophy,
- Very new to programming,
- New to FEM,

# My Problem

Test out some different Finite Elements in FIAT for some mixed methods.

- Learn about Convergence rates,
- Check the error of different finite element,
- Give a head to head comparison on what elements work better.

# How FEniCS works well

- Powerful scripting style environment,
- Quick introduction to standard problems,
- Nice modular interfaces,
- Limited knowledge required to use,
- Rather easy to start changing things.

# Some Difficulties w/ Dolfin mostly

- Documentation
  - Where to go for help?
  - Where to learn about new ways of doing things?
- Programming Petsc or not?
  - Problems with Matrix/Vector wrappers.
  - Limited set of Petsc functionality
- Coding Conventions
  - Should this code be added?
  - Does the code look right?

# Results

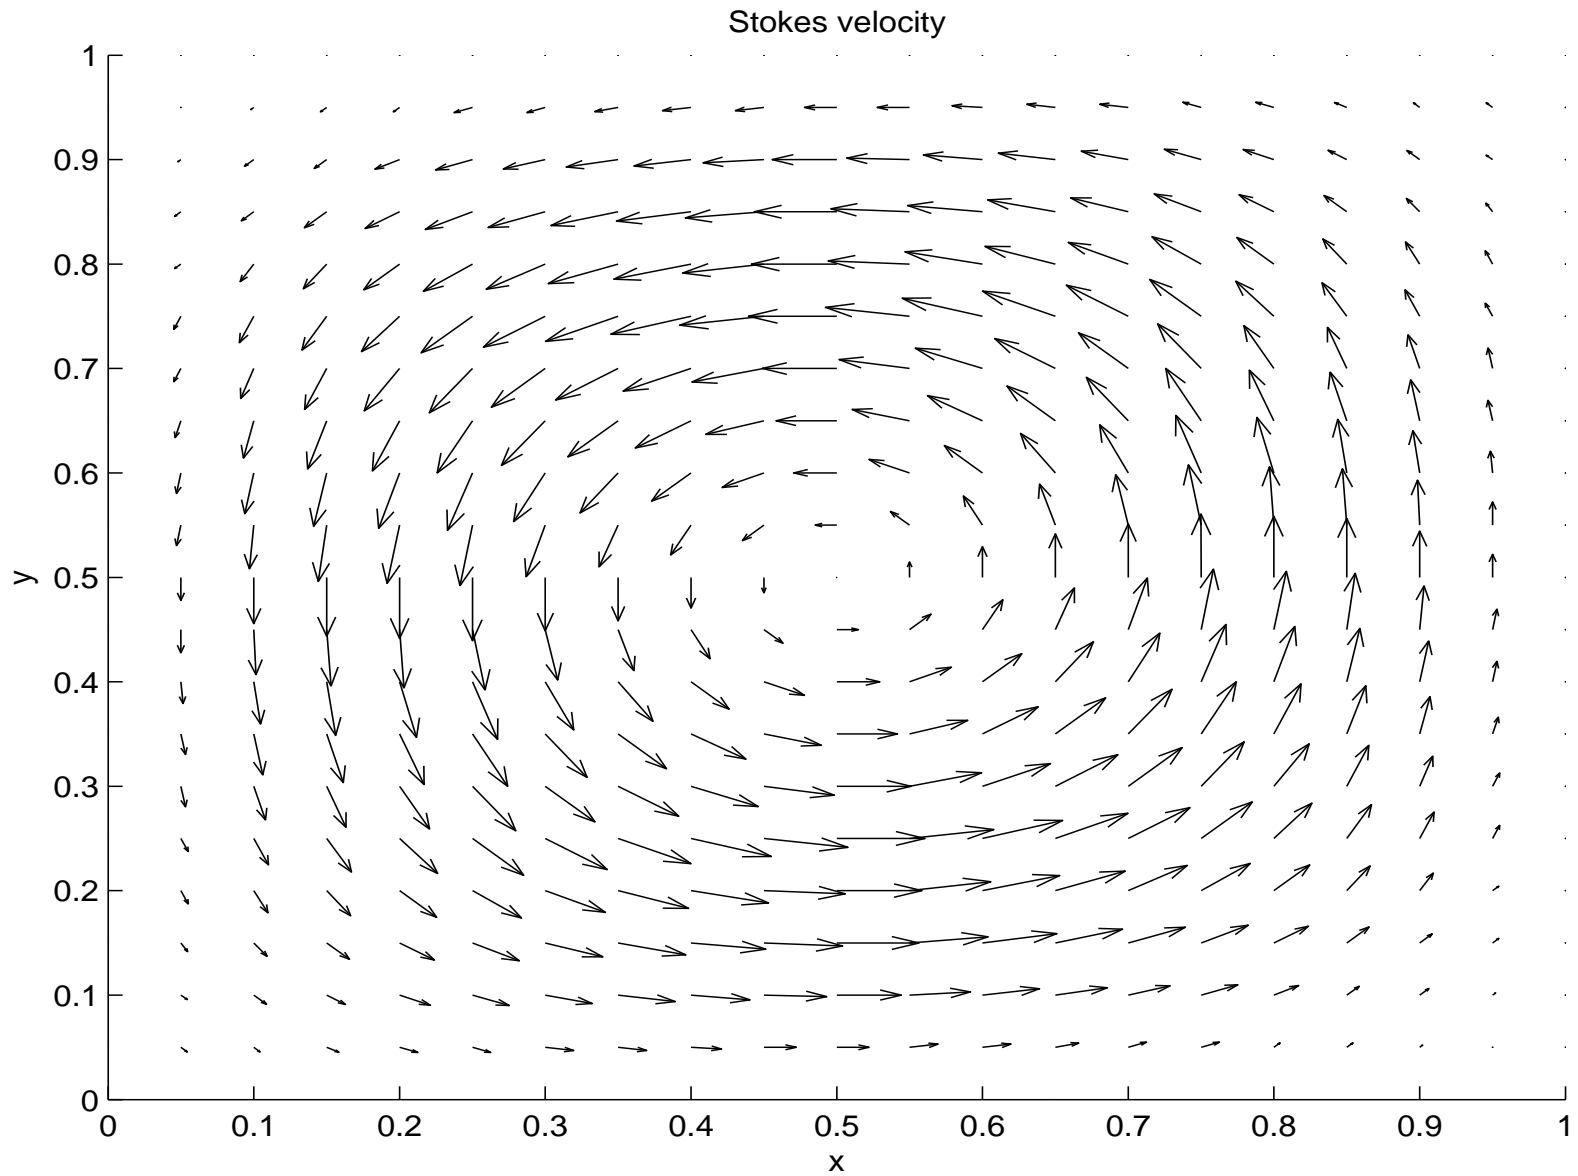

For Stoke equations, with an easy to solve  $u$ :

$$\begin{aligned} -\Delta u + \nabla p &= f \\ \nabla \cdot u &= 0 \end{aligned}, \quad u = \begin{bmatrix} \sin(\pi x) \cos(\pi y) \\ -\cos(\pi x) \sin(\pi y) \end{bmatrix}$$

Using Taylor-Hood elements,

Number of Iterations		
mesh( $n \times n$ )	P1 & P2	P2 & P3
4	14	22
8	24	54
16	83	283
32	328	1319
